

RadCalc QA Software

Advanced platform for independent and unbiased patient quality assurance

St. George Hospital
Dr. Fakhar MD
Medical Director
[Barcode]
[Small text]

Why patient QA?

Safety is a priority in radiation therapy. Protecting patients against ionizing radiation to healthy tissue is essential. Every measurement must be as accurate as possible. Various QA processes can produce different results; therefore, it is imperative to

independently verify calculations a second time.

→ *This is exactly what RadCalc does: independently verify dosimetric calculations in an easy-to-use software platform.*

How do you check calculations of the treatment planning system?

Fast and fully automated patient plan QA is a big step towards a QA process conforming to global standards. RadCalc QA software checks patient plans fast and easy, which allows for more time for your patients. Simply import the patient plans from your planning system. RadCalc automatically calculates in the background with independent

algorithms whether irregularities or deviations are present. As a result, you receive an analysis report. This saves you valuable time and provides you a second check on the calculation of the therapy planning system – fully automated. Enhance safety with an independent secondary check which perfectly suits your existing QA process.

"Nearly 60 % of the reported errors involved a lack of an appropriate independent secondary check of the treatment plan or dose calculation."

According to IAEA Technical Report 430

Accuracy is key

Secondary check of treatment planning

RadCalc is the advanced platform for independent and unbiased patient QA. The seamless integration into existing workflows increases efficiency and safety. Comprehensive documentation and plan analysis tools offer the features medical physicists need.

- *Identify clinically relevant deviations within the entire patient volume using the 3D Monte Carlo or 3D Collapsed Cone algorithms.*
- *Automate your calculations and evaluations while also having*

additional tools available to identify where deviations occur.

- *Save time while also having the opportunity to work from remotely.*

Fast

A fully automated import and export is much faster when compared to manual data entry and eliminates transcription errors.

Accurate

Studies have shown the verification dose to be within $\pm 3\%$ of the treatment plan dose providing excellent accuracy.

Powerful

Most common treatment plans can be verified with RadCalc QA software. Comprehensive analytical features provide powerful tools for physicists for plan analysis.

Independent

RadCalc provides the opportunity to check all results independently from the manufacturer's TPS. This ensures unbiased third party validation.

Easy

Due to its user-friendly interface, the software is easy to use. Clear structure, guided menus, sophisticated layout make the recurring tasks simple and time-saving.

Approved

RadCalc has successfully passed the European CE conformity assessment procedure and is cleared in the USA under 510(k).

Modular and multitasking

Supported modalities

RadCalc includes comprehensive institution and physics data setup, import of radiation therapy plans, automated dosimetric calculations, and

export to record and verify systems. RadCalc also provides powerful reporting tools and flexible site licensing.

→ *Calculations and evaluations can be done automatically in the background, without user interaction.*

MR-Linacs

RadCalc supports secondary point dose and MU verification for MR-Linacs. The calculations take the presence of the magnetic field into account, through the imported measurement profiles. All calculations can be automated together with RadCalc's import, export and reporting features.

TomoTherapy

RadCalc supports TomoHelical, TomoDirect and TomoEDGE and verifies the treatment time and dose to multiple calculation points. Each control point can be visualized together with the illustrated leaf open times. Additionally, the sinogram can be displayed.

Cobalt 60

The Co60 treatment plans can be imported from treatment planning system or from any supported record and verify system. They can contain wedges, blocks and cutouts which can be imported with the plan or defined manually in RadCalc.

Linacs

Besides the 3D Dose calculations with Collapsed Cone or Monte Carlo algorithms, RadCalc performs independent MU or point dose verification calculations for conventional 2D and 3D treatment plans, including Electron, Photon, MLC, 3D Off Axis, Diode and Wedge support. Additional functionality is available with RTP Import, R&V Export and IMRT utilities.

CyberKnife

RadCalc supports CyberKnife machines equipped with fixed Cone, Iris or MLC. The treatment plan can be imported from MultiPlan or from Precision TPS. RadCalc provides point dose calculation options and other features for CyberKnife machines, such as fully automated calculation and reporting.

Superficial

RadCalc superficial calculations are based on real measured values. The software allows the definition of multiple energies with individual HVL values and energy specific parameters. Every energy can have a list of allowed SSDs, cones and measured backscatter factors.

Halcyon/Ethos

RadCalc provides Collapsed Cone 3D and point dose verification for Halcyon and Ethos machines, supporting Varian's dual-layer MLC. For 3D calculations features such as dose volume analysis and gamma calculation, DVH protocols and analysis lines can be utilized.

Gamma Knife

RadCalc performs point dose verification calculations for various Gamma Knife versions and the Leksell GammaPlan (LGP) planning system. It stores and maintains a copy of the Elekta proprietary data providing independent table lookup and interpolation processes.

Brachytherapy

RadCalc supports intracavitary radiotherapy calculations for permanent seed implant, LDR, HDR and Xofig Brachytherapy machines. The calculations are 3D calculations based on the TG-43 protocol. DVH can be calculated with original or translated/rotated source positions and can be compared to imported DVH, and against DVH protocols.

Modality overview and corresponding features

Features of RadCalc Modules

Versatile

Which treatment techniques are supported?

Hypofractionation

During hypofractionation higher doses are delivered to the target within a treatment, than during normal radiation therapy. Accuracy of these treatments are therefore essential. RadCalc's 3D Monte Carlo module employs the most established Monte Carlo dose engine available (BEAMnrc) and also utilizes proprietary machi-

ne modelling acquired from McGill University. Doses volumes verified with RadCalc thus increasing patient safety and plan quality by enhancing your ability to more accurately verify complicated treatment plans. Studies have shown the verification dose to be within $\pm 3\%$ of the treatment plan dose providing very high accuracy.

Adaptive radiation therapy

Radiation therapy continues to grow in complexity, consequently the task of quality assurance has become more time consuming. RadCalc was developed by a ABR board certified physicist to make the task of performing independent dosimetric validation calculations much faster, easier and more accurate.

RadCalc's dosimetric calculations provide a fully automated process for your QA routine which can be seamlessly integrated into adaptive radiation therapy workflows.

SRS/SRBT

RadCalc provides Monte Carlo and Collapsed Cone Convolution Superposition based algorithm modules that deliver fast, easy, and accurate 3D Dose Volume verification. Utilizing a patient's planning CT for calculations, RadCalc's 3D functionality offers verification for 3D, IMRT, VMAT, and SRS/SBRT plans.

Dose throughout the treatment volume is verified with RadCalc thus increasing patient safety and plan quality by enhancing your ability to more accurately verify complicated SRT/SBRT treatment plans.

Intensity Modulated Radiation Therapy – IMRT

RadCalc's point dose calculation algorithm supports step-and-shoot, sliding window and compensator based IMRT treatment plans. The IMRT computation is performed utilizing a modified Clarkson scatter integration along with a head scatter algorithm to improve accuracy. The MLC leaf sequence patterns can be imported into RadCalc through various mechanisms. The MLC patterns can be changed and exported to a R&V system.

Volumetric Arc Therapy – VMAT

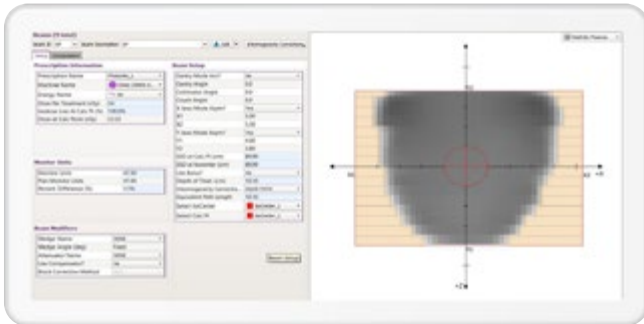

A regions of interest module is part of RadCalc's photon calculations for performing second check verifications for VMAT. ROI structures are exported with the plan file from the VMAT calculation to the RadCalc software. Average densities for the various structures can be either imported or manually entered. RadCalc computes an independent depth and effective depth value for each individual control point as well as the dose comparison for all imported calculation points. Additionally, an average depth and effective depth are determined. Users can also utilize the Volume Average Dose Tool to analyze the variation in dose (at a given distance) around the primary calculation point.

Brachytherapy techniques

RadCalc follows the TG-43 protocol to perform 3D dose volume and point dose verification for HDR (incl. Xofig), LDR and for Permanent Implant treatments. The TPS and RadCalc dose can be compared side by side in either 2D or 3D views. Isodose levels can be displayed, Dose Volume analysis can be performed using Percent Difference DTA or Gamma analysis and DVH protocols can be used.

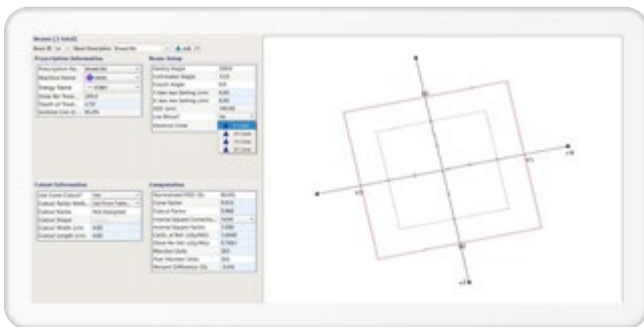

RadCalc can compute the dose and DVH based on translated and/or rotated source for an individual treatment. Comparing the isodoses, DVH with the optimal source position the clinical impact of a source mislocation can be evaluated.

Point dose analysis

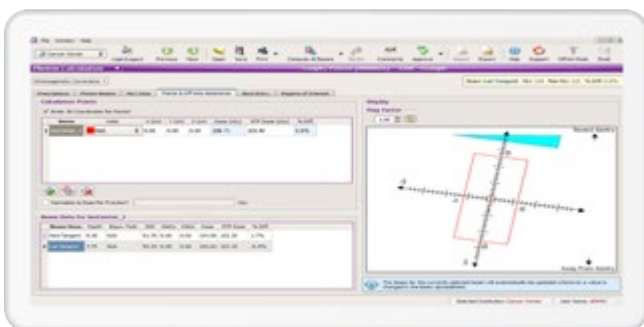

IMRT Treatment Plans

RadCalc supports Step & Shoot, Sliding Window, Dynamic Arc, VMAT, and Compensator based IMRT calculations with the ability to view MLC and calculate fluence and dose map patterns. For improved accuracy of breast plan calculations, RadCalc allows you to draw the breast outline so that the loss of scatter due to missing tissue is taken into account.

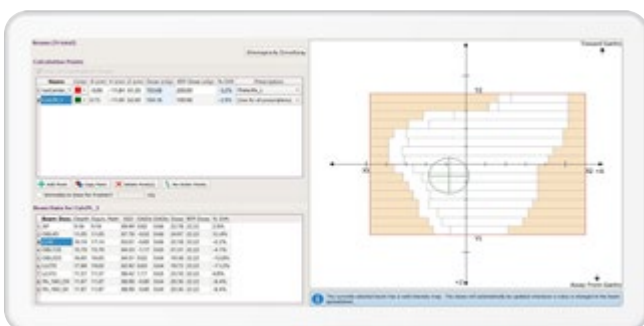

Electron & Photon Calculations

Fast calculations can be performed by using the EZ Photon and Electron tools. Photon computations utilizing a Clarkson summation or other methods can be done on MLC and complex block outlines. For electron calculations, a library of custom cutouts can be maintained. Cutout factors can be computed using a sector integration or square root method.

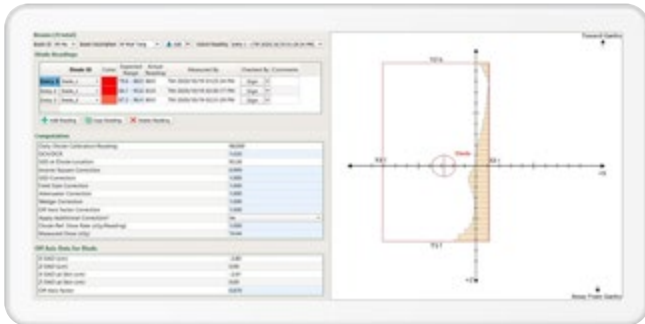

Wedges

RadCalc supports most wedge types such as Varian's Enhanced Dynamic Wedge (EDW), Elekta's Motorized Wedge, Siemens's Virtual Wedge (VW) and Hard wedges. Off axis calculations may be performed for all supported wedge types. By utilizing separate PDD data, RadCalc accommodates beam hardening.

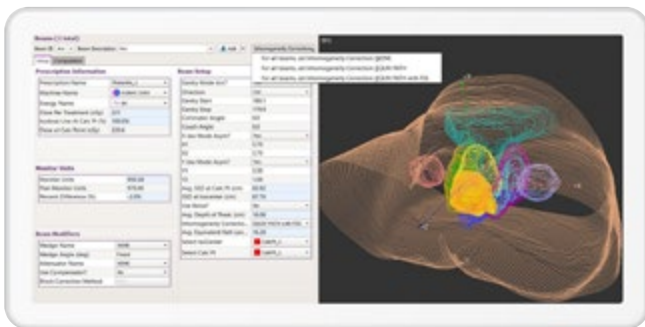

3D off Axis Assistance

RadCalc's use of 3D coordinates simplifies the process of off axis calculations by automatically computing the off axis distances in the Beams Eye View (BEV). The tool can also be used to manually position the off axis point.

Diodes

RadCalc can perform diode calculations for both Photon and Electron beam types by computing an expected reading or range based upon the Dmax dose. Correction factors for Photon beams may include: SSD, field size, attenuator factors, wedge factors, and off axis factors. Cone correction factors may be used for Electron beams.

Regions of Interest

This tool allows for a more robust and accurate VMAT calculation while also eliminating the need to manually enter depths and effective depths for conventional photon and IMRT computations.

Plan comparison

With this feature users can compare the plan from the R&V system with the plan data directly exported from the TPS, thus discovering errors during the plan export process. They can also easily analyze two arbitrary plans and see whether the beam parameters are the same in the plans or highlight potential differences.

Fluence and Dose Map

Users can extend the pre-treatment MU verification with comparing RadCalc calculated Dose Map with a measured, or TPS calculated Dose Map and with comparing the RadCalc calculated fluence with TPS fluence or calculated fluence from Linac log file.

Diode and TLD calculations

RadCalc performs in-vivo diode calculations for photon and electron beams by computing an expected reading or range, based on the Dmax dose. Results can be collected through the course of treatment and stored with the secondary dose verification calculations. By transferring the results to the R&V System it can be part of the complete patient documentation.

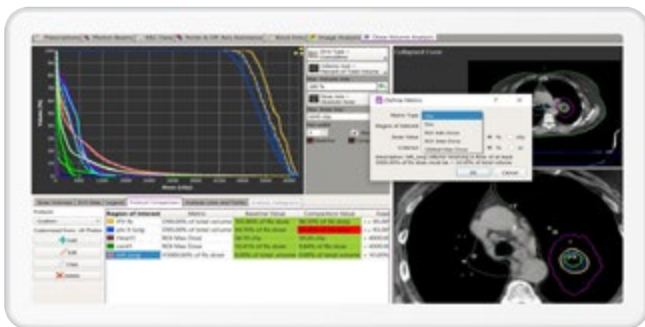

3D Functionalities

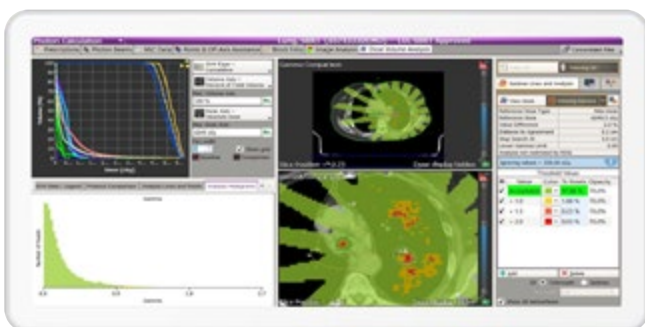

3D Calculation Algorithms

RadCalc provides Collapsed Cone Convolution Superposition and Monte Carlo based algorithm modules that deliver fast, easy, and accurate 3D Dose Volume verification. Monte Carlo is widely recognized as the gold standard dose calculation method. RadCalc's 3D Monte Carlo module employs the most established Monte Carlo dose engine available (BEAMnrc), and also utilizes proprietary machine modelling acquired from McGill University.

DVH Protocols

Any number of DVH protocols can be defined used from the analysis screen within RadCalc. Using Rules in RadCalc, different DVH protocols can be automatically selected and applied to the specific plan. RadCalc automatically checks whether the DVH objectives are met for critical structures using both the TPS and RadCalc's 3D dose. Analysis reports are automatically attached to your verified plan and sent to your workstation via email or to a directory of your choice on your server.

3D Dose Analysis

RadCalc provides Percent difference, DVH, Distance to Agreement, Gamma analysis tools to evaluate 3D computations. The functionality includes RadCalcAIR (Automated Import & Report) providing a fully automated process for plan import, computation, 3D dose analysis and report generation. RadCalc's fully automated process immediately alerts you to plans that fail to pass your pre-set Gamma Analysis acceptance criteria. RadCalc allows automatically applying different Gamma Calculation Defaults and Acceptance Criteria based on user defined Rules.

$$\frac{a}{x} \cdot \frac{1}{y} = \frac{a}{xy} + y +$$

$$= \frac{a}{xy} + \frac{y \cdot x}{xy} + \frac{a}{x}$$

$$\left(\frac{a}{xy}\right) \cdot \frac{1}{y} = \frac{a}{xy^2}$$

$$\left(\frac{a}{xy}\right) \cdot \frac{1}{y} = \frac{a}{xy^2}$$

$$\left(\frac{a}{xy}\right) \cdot \frac{1}{y} = \frac{a}{xy^2}$$

$$\frac{a}{xy} \cdot \frac{1}{y} = \frac{a}{xy^2}$$

$$\frac{a}{xy} \cdot \frac{1}{y} = \frac{a}{xy^2}$$

Calculation Algorithms

Besides the Clarkson algorithm for point dose calculations RadCalc provides Collapsed Cone Convolution Superposition and Monte Carlo based algorithm modules that deliver fast, easy, and accurate 3D Dose Volume verification for most commonly used treatment planning systems. Treatments have become more complex

with higher dose per fraction. Monte Carlo is known as the most accurate calculation algorithm. Doses in inhomogeneous structures such as lung tissue are calculated with very high accuracy. Sparing healthy tissue is always a major goal in radiation therapy. Hence, dose calculation accuracy is imperative.

"Since the very beginning of the adoption of IMRT at our department (year 2001) I was convinced of the importance of a second check of the MU calculation. As soon as I knew that LifeLine Software was working on a full 3D solution with Monte Carlo algorithm I thought that we could not miss such opportunity. We're glad of being the first Italian site using RadCalc 3DMC."

Seamless and easy Workflow integration

Treatment plan generation

- Store plan as DICOM or RTP file
- Export from Pinnacle via hotscript
- Send to RadCalc's DICOM RT receiver

Plan import

- Automated import by RadCalc AIR
- Manual file import

Pre-treatment dose verification

- IMRT, VMAT; SRS
- Effective depth calculation
- Monte Carlo dose calculation
- Collapsed Cone dose calculation
- Gamma/DVH protocol calculation

Pre- or post treatment image analysis

- Fluence map calculation
 - Dose map calculation
 - Fluence reconstruction from Linac log files
 - 3D EPID dosimetry
- RadCalc 3D EPID is not yet available for sale – work in progress.

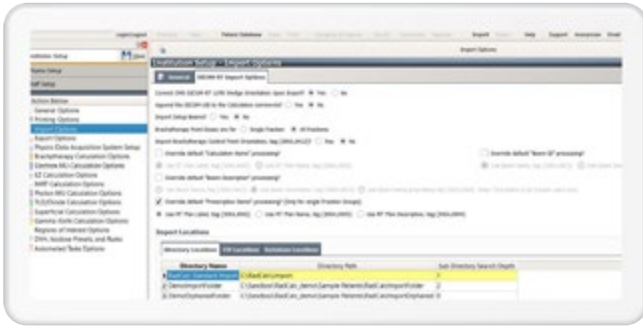

Report generation and automatic backup

- DVH protocols
- Gamma criteria
- Report sent by email
- Immediate alert of failed plans

Result evaluation

- Evaluation by RT expert
- Report stored in R&V system

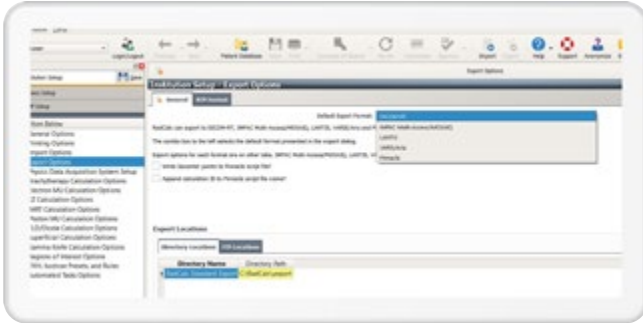

RadCalc's import utilities

RadCalc allows you to import from radiation therapy planning systems, verify and record systems, and/or virtual simulation software through DICOM RT or other proprietary formats. Third party products supported by RadCalc:

Supported formats

- DICOM RT
- Eclipse: DICOM RT, Print Template in Eclipse to provide missing effective depth information
- Nucletron Plato Brachytherapy: direct FTP connection
- RTP Format: IMPAC/MOSAIC, LANTIS, Varis
- MIMiC Plan: Hybrid Plan Import
- GammaKnife: direct import from the GammaPlan ODBC Database
- Pinnacle: DICOM RT, Hotscript, Direct FTP connection (Prior to Pinnacle version 9.0)
- CyberKnife: from MultiPlan and Precision TPS
- Zap-X plan: import from the Zap-X treatment planning system

RadCalc's export utilities

RadCalc provides an export utility that allows users to export treatment plans to a format readable by a record and verify system. Exporting to record and verify systems saves re-entry of data, ensures that patient's medical records contain the verification results and allows users to export customized plans for special QA processes. Transferred data includes:

- Treatment field parameters and MU
- Ccouch angle
- Treatment dose
- Beam name
- Field size
- Wedge information
- Gantry angle
- Treatment depth
- Either static or dynamic MLC leaf sequences
- Collimator angle
- SSD
- Prescription information

Users may export plans and calculations to any record and verify system that accepts DICOM RT or RTP Connect format files.

Which hardware is required?

General requirements

Operating System	Microsoft® Windows® 7, 8, 8.1, 10, 32-bit and 64-bit operating systems
Processor	Intel i5 or equivalent
Memory	4 GB (RAM)
Video	Minimum resolution 1024×768 and minimum 1 GB video memory (RAM)
Graphics	OpenGL 1.1 support required
Hard drive space	1 GB available. Varies with quantity and type of patient data

Recommended dose engine hardware specifications Collapsed Cone Module

Operating System	Windows 64-Bit OS (8, 10, Server 2012, 2016, or 2019)
GPU	NVIDIA GeForce RTX 2080 Ti, or similar (Must be NVIDIA)
CPU	Intel Core i7-9700, 8 Core, 12 MB Cache, or better
RAM	16 GB or more
Disk	512 GB SSD or more

Recommended dose engine hardware specifications Monte Carlo Module

Operating System	Windows 64-Bit OS (8, 10, Server 2012, 2016, or 2019)
CPU	Dual Intel Xeon Gold 5220, 2.2GHz, 3.9GHz Turbo, 18 Core, or better
RAM	64 GB or more
Disk	512 GB SSD or more

About us

LAP is one of the world's leading suppliers of systems that increase quality and efficiency through laser projection, laser measurement, and other processes. Every year, LAP supplies 15,000 units to customers in industries as diverse as radiation therapy, steel production, and composite processing. LAP employs 300 people at locations in Europe, America and Asia.

In order to achieve this vision, we look for associates and business partners who share our passion to serve others through their hard work and dedication to excellence in all they do every day. We do our best to create a work environment that encourages our associates to listen to their customers, both inside and outside our company and to deliver results with integrity.

LifeLine Software, Inc., the developer of RadCalc, is part of the LAP Group. We are driven to improve the lives of those who fight cancer. We help to assure that they are receiving quality treatments. Our goal is to create the highest quality software products. We strive to achieve this goal by our commitment and dedication to continuous improvement of all we do in responding to the needs of our customers for the benefit of the patients and families they serve.

RadCalc is our commitment to responding to the needs of Radiation Oncology health care providers by contributing to the enhancement of the quality of their work, and to the quality of life of their patients. RadCalc was developed by our board-certified physicist to make independent Dosimetric calculation verification accurate, quick, and easy.
